

# TWO MORE THEOREMS ABOUT DIFFERENTIATION IN BANACH SPACE

S. SCHECTER

**Theorem 1.** *Let  $X_1, \dots, X_k, Y$  be Banach spaces. For each  $i = 1, \dots, k$ , let  $D_i$  be an open subset of  $X_i$ . Let  $f : D_1 \times \dots \times D_k \rightarrow Y$  be a function. Assume:*

- (1) *At each  $(x_1, \dots, x_k) \in D_1 \times \dots \times D_k$ , each partial derivative  $D_i f(x_1, \dots, x_k)$  exists.*
- (2) *For each  $i$ , the mapping from  $D_1 \times \dots \times D_k$  to  $L(X_i, Y)$  given by  $(x_1, \dots, x_k) \rightarrow D_i f(x_1, \dots, x_k)$  is continuous.*

*Then  $f$  is  $C^1$ , and  $Df(x_1, \dots, x_k)(h_1, \dots, h_k) = D_1 f(x_1, \dots, x_k)h_1 + \dots + D_k f(x_1, \dots, x_k)h_k$ .*

*Proof.* We'll do the case  $k = 2$  only. Differentiability:

$$\begin{aligned} & f(x_1 + h_1, x_2 + h_2) - f(x_1, x_2) - (D_1 f(x_1, x_2)h_1 + D_2 f(x_1, x_2)h_2) \\ &= f(x_1 + h_1, x_2 + h_2) - f(x_1 + h_1, x_2) + f(x_1 + h_1, x_2) - f(x_1, x_2) - (D_1 f(x_1, x_2)h_1 + D_2 f(x_1, x_2)h_2) \\ &= \left( \int_0^1 D_2 f(x_1 + h_1, x_2 + sh_2) - D_2 f(x_1, x_2) ds \right) h_2 \\ &\quad + \left( \int_0^1 D_1 f(x_1 + sh_1, x_2) - D_1 f(x_1, x_2) ds \right) h_1. \end{aligned}$$

Since each  $D_i f(x_1, x_2)$  depends continuously on  $(x_1, x_2)$ , for  $\epsilon > 0$  we have

$$\begin{aligned} & |f(x_1 + h_1, x_2 + h_2) - f(x_1, x_2) - (D_1 f(x_1, x_2)h_1 + D_2 f(x_1, x_2)h_2)| \\ &\leq \sup_{0 \leq s \leq 1} |D_2 f(x_1 + h_1, x_2 + sh_2) - D_2 f(x_1, x_2)| |h_2| \\ &\quad + \sup_{0 \leq s \leq 1} |D_1 f(x_1 + sh_1, x_2) - D_1 f(x_1, x_2)| |h_1| \leq \frac{\epsilon}{2} |h_2| + \frac{\epsilon}{2} |h_1| \leq \epsilon |(h_1, h_2)| \end{aligned}$$

for  $|(h_1, h_2)|$  sufficiently small. This shows that  $f$  is differentiable and the derivative is the given formula.

$C^1$ :

$$\begin{aligned} & (Df(x'_1, x'_2) - Df(x_1, x_2))(h_1, h_2) \\ &= (D_1 f(x'_1, x'_2) - D_1 f(x_1, x_2))h_1 + (D_2 f(x'_1, x'_2) - D_2 f(x_1, x_2))h_2. \end{aligned}$$

Since each  $D_i f(x_1, x_2)$  depends continuously on  $(x_1, x_2)$ , for  $\epsilon > 0$  we have

$$|(Df(x'_1, x'_2) - Df(x_1, x_2))(h_1, h_2)| \leq \frac{\epsilon}{2} |h_1| + \frac{\epsilon}{2} |h_2| \leq \epsilon |(h_1, h_2)|$$

for  $|(x'_1, x'_2) - (x_1, x_2)|$  sufficiently small. Hence for  $|(x'_1, x'_2) - (x_1, x_2)|$  sufficiently small,  $\|Df(x'_1, x'_2) - Df(x_1, x_2)\| \leq \epsilon$ .  $\square$

**Theorem 2.** *Let  $X_1, \dots, X_k, Y$  be Banach spaces. Let  $M : X_1 \times \dots \times X_k \rightarrow Y$  be a bounded  $k$ -multilinear map. Then  $M$  is  $C^1$ , and  $DM(x_1, \dots, x_k)(h_1, \dots, h_k) = M(h_1, x_2, \dots, x_k) + M(x_1, h_2, x_3, \dots, x_k) + \dots + M(x_1, \dots, x_{k-1}, h_k)$ .*

*Proof.* The steps are:

- (1) If we fix everything but  $x_i$ , then  $M$  is linear in  $x_i$ . Therefore

$$D_i M(x_1, \dots, x_{i-1}, x_i, x_{i+1}, \dots, x_k) h_i = M(x_1, \dots, x_{i-1}, h_i, x_{i+1}, \dots, x_k).$$

This is a bounded linear map because

$$|M(x_1, \dots, x_{i-1}, h_i, x_{i+1}, \dots, x_k)| \leq \|M\| |x_1| \cdots |x_{i-1}| |h_i| |x_{i+1}| \cdots |x_k|,$$

so a bound is  $\|M\| |x_1| \cdots |x_{i-1}| |x_{i+1}| \cdots |x_k|$ .

- (2) Now we just need to show that for each  $i$ , the map  $(x_1, \dots, x_k) \rightarrow D_i f(x_1, \dots, x_k)$  is continuous. Then we can apply the previous theorem to get the result.

Let's just look at the case  $k = i = 3$ . We want to show that the  $(x_1, x_2, x_3) \rightarrow D_3 f(x_1, x_2, x_3)$  is continuous. The map  $(x_1, x_2, x_3) \rightarrow D_3 f(x_1, x_2, x_3)$ , from  $X_1 \times X_2 \times X_3$  to  $L(X_3, Y)$ , takes  $(x_1, x_2, x_3)$  to the linear map  $h_3 \rightarrow M(x_1, x_2, h_3)$ . It is the composition of two maps:

(a)  $(x_1, x_2, x_3) \rightarrow (x_1, x_2)$  from  $X_1 \times X_2 \times X_3$  to  $X_1 \times X_2$ .

(b)  $(x_1, x_2) \rightarrow$  the linear map  $h_3 \rightarrow M(x_1, x_2, h_3)$ , from  $X_1 \times X_2$  to  $L(X_3, Y)$ .

The first is bounded linear, the second is bounded bilinear. Thus each is continuous, so the composition is continuous.
